

# FREE STANDING PARTITIONS

Occasionally, there are site situations with no possibility of constructing overhead or lateral supporting structures. Airport terminals and other similar large concourses usually have roofs that are much too high to drop supports down to operate sliding products. The fixed support frames needed for rolling closures may present unacceptable obstacles in public spaces. We offer the revolutionary "Roll-a-Way" moveable partition as a six foot high lockable barrier to enclose retail kiosks, to control pedestrian movement and to divide or restrict access to large spaces. Roll-a-Way partitions are locked at the ends with standard cylinder controlled hookbolts into receiving strikers. Intermediate drop bolts that lock into floor sockets may also be added to prevent their being forced out of position at the midpoints. Successively smaller sections, easier and safer to roll in to position, may be locked together to form longer barriers.
